

Prompt

You are a mid-level manager who wants to understand trends in the avocado market in the USA. Using only the information contained in the two uploaded files (2025 and 2026 avocado data), prepare a professional business memo addressed to me that analyzes the trends shown in the data. The memo must be no longer than 2 pages and should be written in a clear, concise, professional business style. Do not hallucinate or invent any information, and do not make up, assume, or infer facts that are not supported by the uploaded data. Do not use outside sources, websites, general avocado-market knowledge, or information from your training data. Every factual statement, number, percentage, trend, or conclusion must be directly supported by the two uploaded files. If the files do not contain enough information to answer something, explicitly state that the information is not available in the provided data rather than guessing. Double-check all calculations before including them and clearly distinguish between what the data directly shows and any interpretation of the data. Do not fabricate explanations for why a trend occurred. If the data shows that something changed but does not explain why, simply state the observed change without speculating about its cause. The memo should discuss major changes and trends between 2025 and 2026, including changes in avocado sales or revenue, volume, prices, or other relevant measures contained in the files, as well as differences or trends by relevant categories, regions, or avocado types. Include percentage increases or decreases when they can be accurately calculated from the provided data and identify notable patterns that would be useful for a mid-level manager to understand. End with a concise conclusion highlighting the most important findings supported by the data. Format the response as a professional memo with To, From, Date, and Subject sections, using “Mid-Level Manager” as the recipient, “AI” as the sender, and “USA Avocado Market Trends: 2025–2026” as the subject. Before writing the final memo, carefully inspect both files and verify that every figure and calculation included in the memo is supported by the uploaded data. Do not include any information that you cannot verify from the two files.

To: Mid-Level Manager
From: AI
Date: September 27, 2026
Subject: USA Avocado Market Trends: 2025–2026

Overview

This memo analyzes the avocado data provided for 2025 and 2026. To make the comparison consistent, the analysis compares Weeks 1–32 of each year, corresponding to January 2025 through August 10, 2025, and January 2026 through August 9, 2026. The files contain volume, ASP (average selling price), avocado type, geography, variety, and bag-size information. They do not contain a separate sales-revenue field; therefore, revenue is not reported or estimated in this analysis.

National Volume and ASP Trends

The data shows that total U.S. avocado volume increased from 1.871 billion in Weeks 1–32 of 2025 to 2.126 billion in the comparable period of 2026, an increase of 13.6%. Volume was higher in 2026 than in 2025 in each of the 32 individual weeks.

At the same time, the national ASP decreased from 1.245 in 2025 to 1.008 in 2026, a decline of approximately 19.1%. The lower ASP occurred throughout all 32 comparable weeks. The difference was particularly large during Weeks 1–16, when the average weekly ASP was approximately 23%–25% lower in 2026. The gap narrowed during Weeks 25–32, when the average ASP was approximately 6.4% lower than in 2025.

The combination of higher volume and lower ASP is the most significant national pattern in the data: the market recorded substantially more volume in 2026 while the ASP measure was lower.

Conventional and Organic Avocados

The increase in total volume was concentrated in conventional avocados. Conventional volume increased from 1.765 billion to 2.021 billion, or 14.5%, while its ASP decreased approximately 19.4%, from 1.215 to 0.979.

Organic volume was relatively stable, decreasing from 105.9 million to 105.1 million, or 0.7%. Organic ASP declined approximately 10.3%, from 1.741 to 1.562. Consequently, conventional avocados represented approximately 94.3% of total U.S. volume in 2025 and 95.1% in 2026, while organic's share decreased from approximately 5.7% to 4.9%.

Variety and Bag-Size Trends

The data also shows different patterns among avocado varieties. National volume for variety 4046 increased 2.5%, from 867.2 million to 889.1 million. Variety 4225 increased 35.6%, from 197.3 million to 267.5 million. Variety 4770 increased approximately 106.6%, from 23.9 million to 49.5 million.

Bagged volume increased 17.6%, from 782.3 million to 919.8 million. Within bagged volume, small-bag volume increased 11.9%, large-bag volume increased 57.3%, and extra-large-bag volume increased 215.3%. The unknown bag-size category increased 19.4%. These changes indicate that the overall increase in volume was accompanied by increases across the reported bag-size categories, although the magnitude differed substantially.

Regional Trends

All seven regional geographies reported in the files had higher volume in Weeks 1–32 of 2026 than in the comparable 2025 period. The Southeast had the largest percentage increase, with volume rising 19.8%. California increased 15.0%, the Midsouth increased 14.8%, South Central increased 14.2%, the Northeast increased 13.7%, the Great Lakes increased 12.6%, and the West increased 7.0%.

ASP decreased in every region. The largest regional ASP decline was in the Southeast, at approximately 24.7%, while the Northeast had the smallest decline at approximately 15.3%.

Conclusion

The primary trends supported by the data are higher avocado volume and lower ASP in 2026 compared with the comparable period of 2025. The volume increase was primarily associated with conventional avocados, while organic volume remained nearly unchanged. Variety 4225 and especially 4770 experienced substantial volume increases, and bagged volume increased with particularly large growth in large and extra-large bag categories. Regionally, all reported regions increased in volume while ASP declined. The data documents these changes but does not provide information explaining why they occurred.

Comment: The AI-generated memo did not include the Plains region.
